

# An inter-method comparison of drones, airplanes, satellites and side scan sonar for eelgrass mapping

Jill Carr | MassBays NEP | [jillian.carr@umb.edu](mailto:jillian.carr@umb.edu)  
Todd Callaghan | MA CZM | [todd.callaghan@mass.gov](mailto:todd.callaghan@mass.gov)

**Massachusetts Bays**  
NATIONAL ESTUARY PARTNERSHIP

# The problem

*Reliance on remotely-sensed eelgrass data*

*Low confidence in some portions of the meadow*

*Inadequate protection → net loss*

# Questions

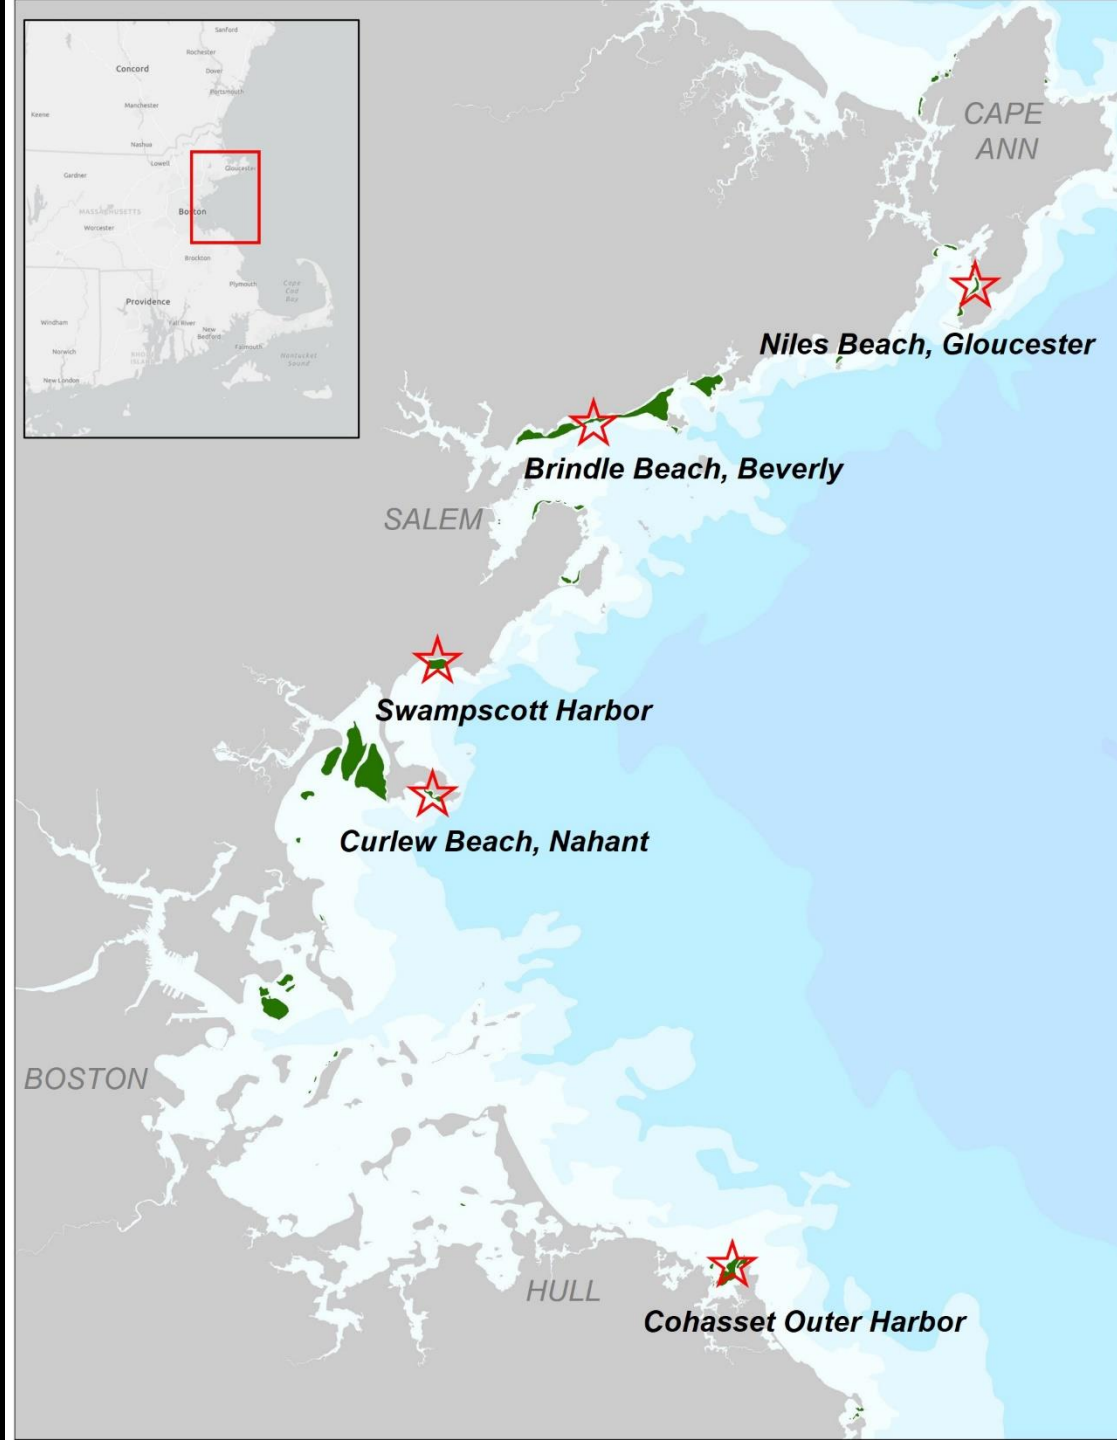

How accurate are eelgrass maps generated from remote sensing imagery?

*Q1: How does the remotely-sensed edge compare to diver-measured edge*

*Q2: What are the effects of percent cover, canopy height and patchiness at the edge*

# Study Design

- *Five sites eastern MA*
- *Acquired semi-synchronous imagery via satellite, airplane, drone and side scan sonar*
- *Underwater photo ground truthing and diver transects*
- *Summer 2022*

+

# Satellite

- Imagery acquired from PLANET SuperDove satellites
- 3 m pixel resolution
- NASA Commercial SmallSat Program

# Airplane

- MassDEP long-term program (1995+)
- 25 cm pixel resolution

# Drone

- DJI Phantom 4 Pro V2
- 3 cm pixel resolution
- Image processing in DroneDeploy

# Side Scan Sonar

- Humminbird Helix 9 sonar
- “Mow the lawn” pattern
- 50 cm pixel resolution

# Dive Survey

Two shallow transects, one deep transect per site

Last shoot, perpendicular to shore  
(no other shoots within 20 m)

- Eelgrass percent cover
- Canopy height
- Algae and animals
- Distribution type (patchiness)  
<1m, 1-5m, >5m

Fine Percent Cover Values
< 1%
1 to < 10%
10 to < 20%
20 to < 30 %
30 to < 40 %
40 to < 50 %
50 to < 60 %
60 to < 70 %
70 to < 80 %
80 to < 90%
90 to 100%

# Photo-Groundtruthing

- Randomly sample 30 stations around diver transects
- Eelgrass % cover (CMECS)

Heads Up manual photointerpretation

Pre-determined rules (MMU, smoothing, manipulations)

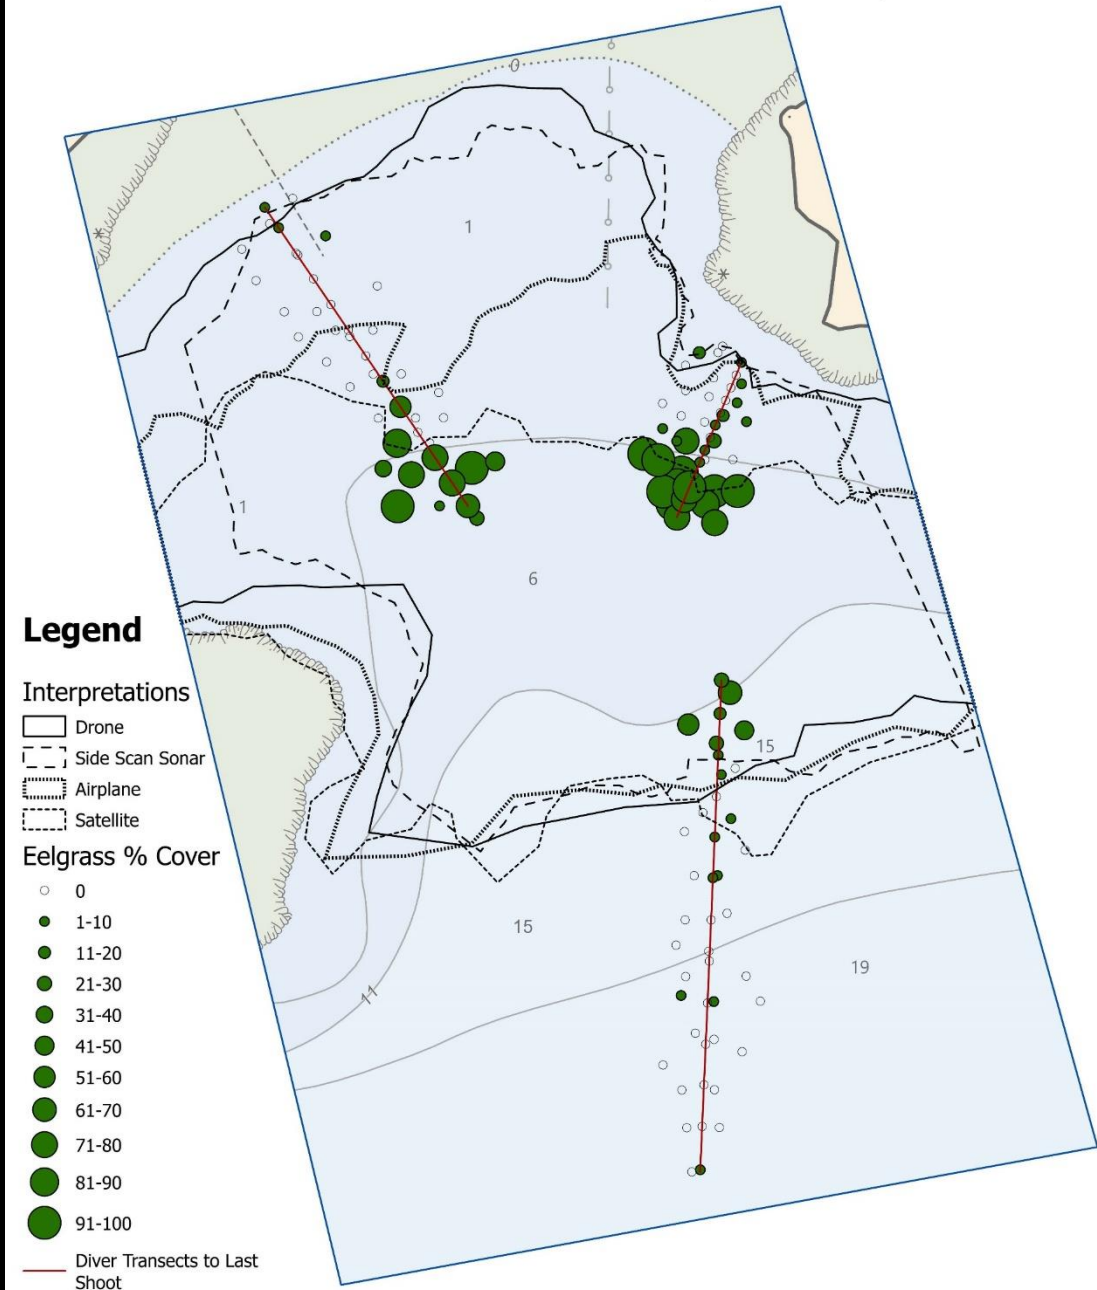

## Spatial analysis of

- Edge error
- Eelgrass % cover, canopy height and distribution type
- Accuracy assessment

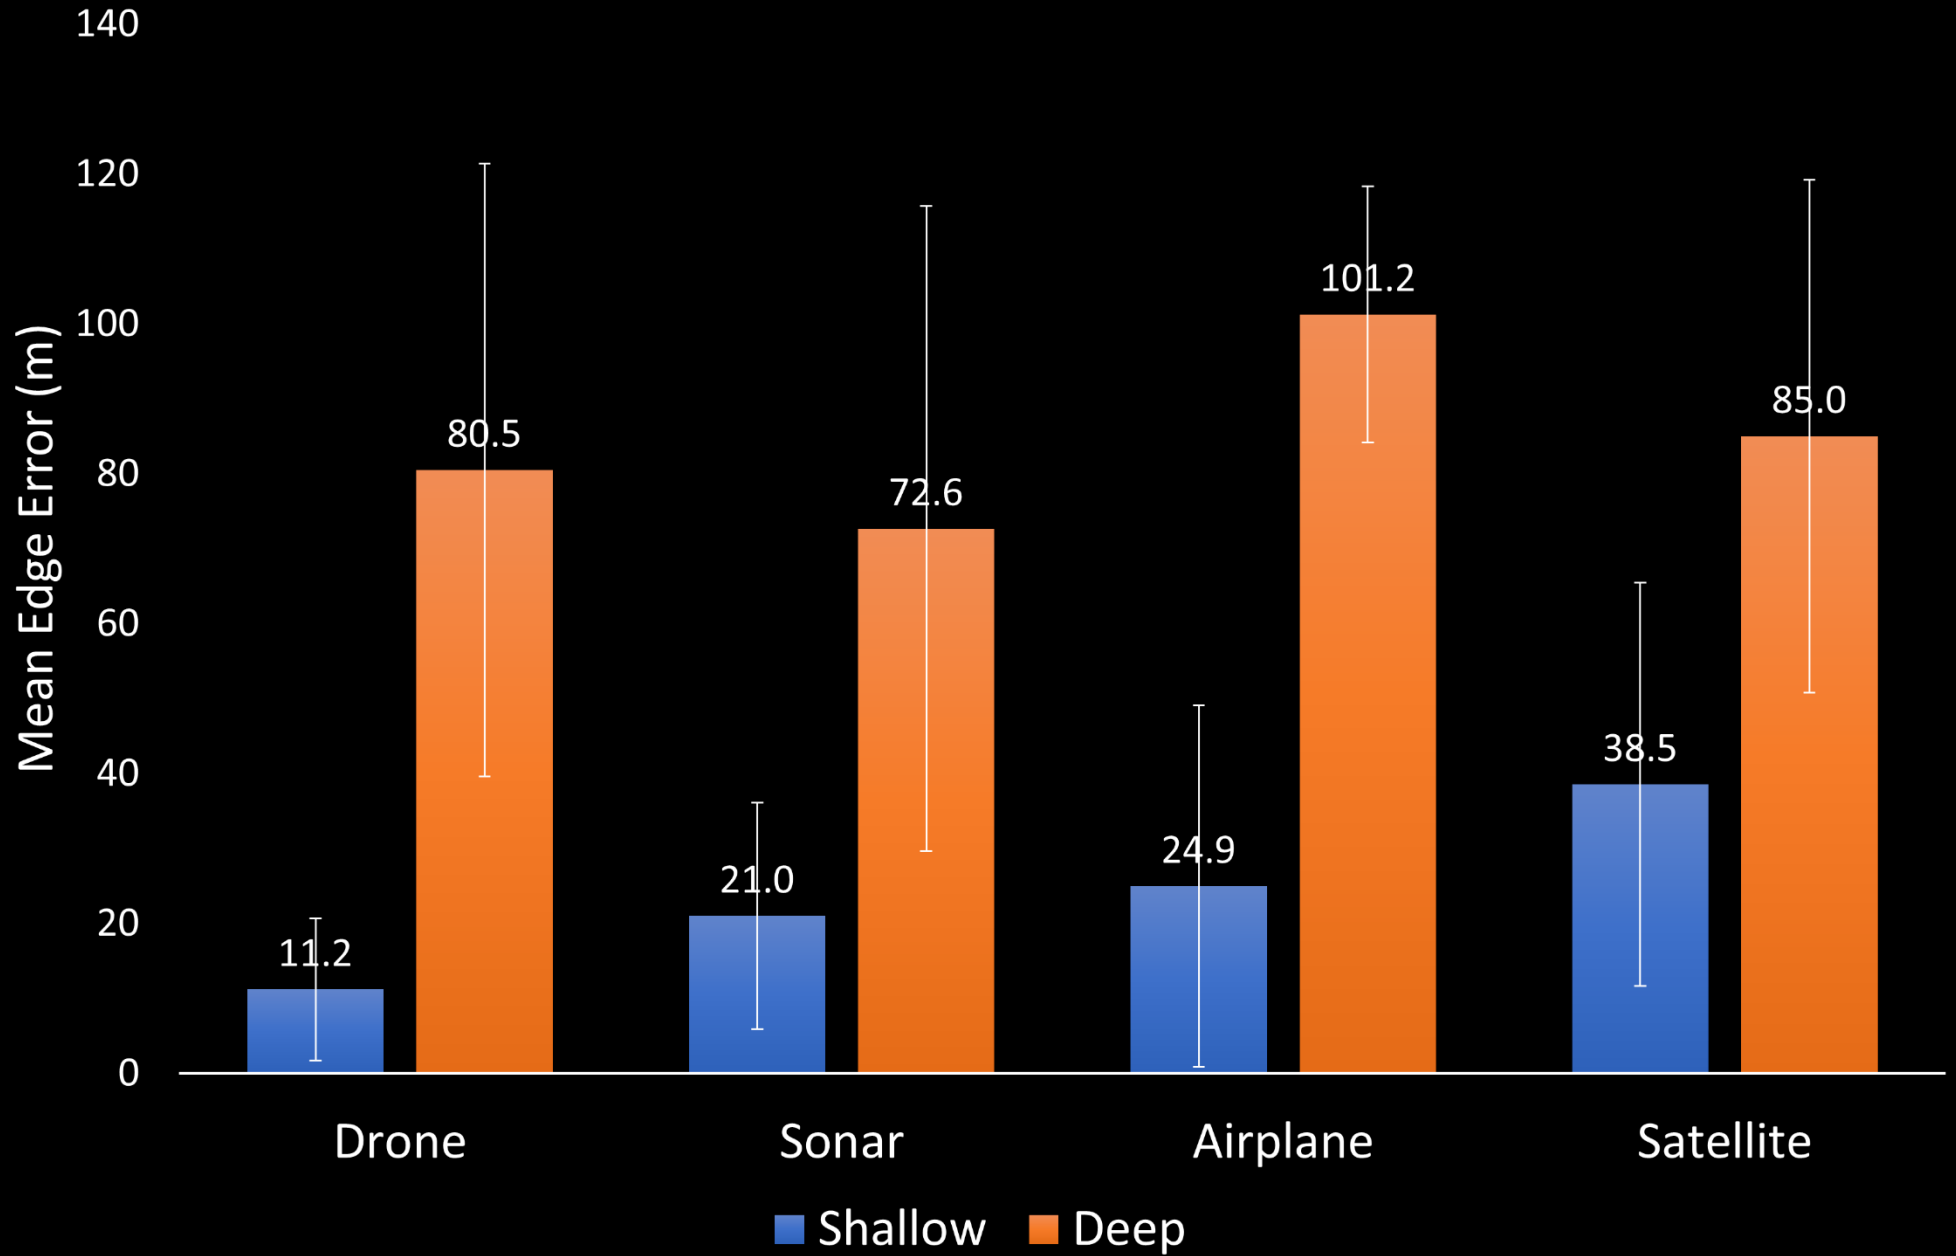

Brindle Beach, Beverly

0 12.5 25 50 Meters

N

# Results: Edge Error

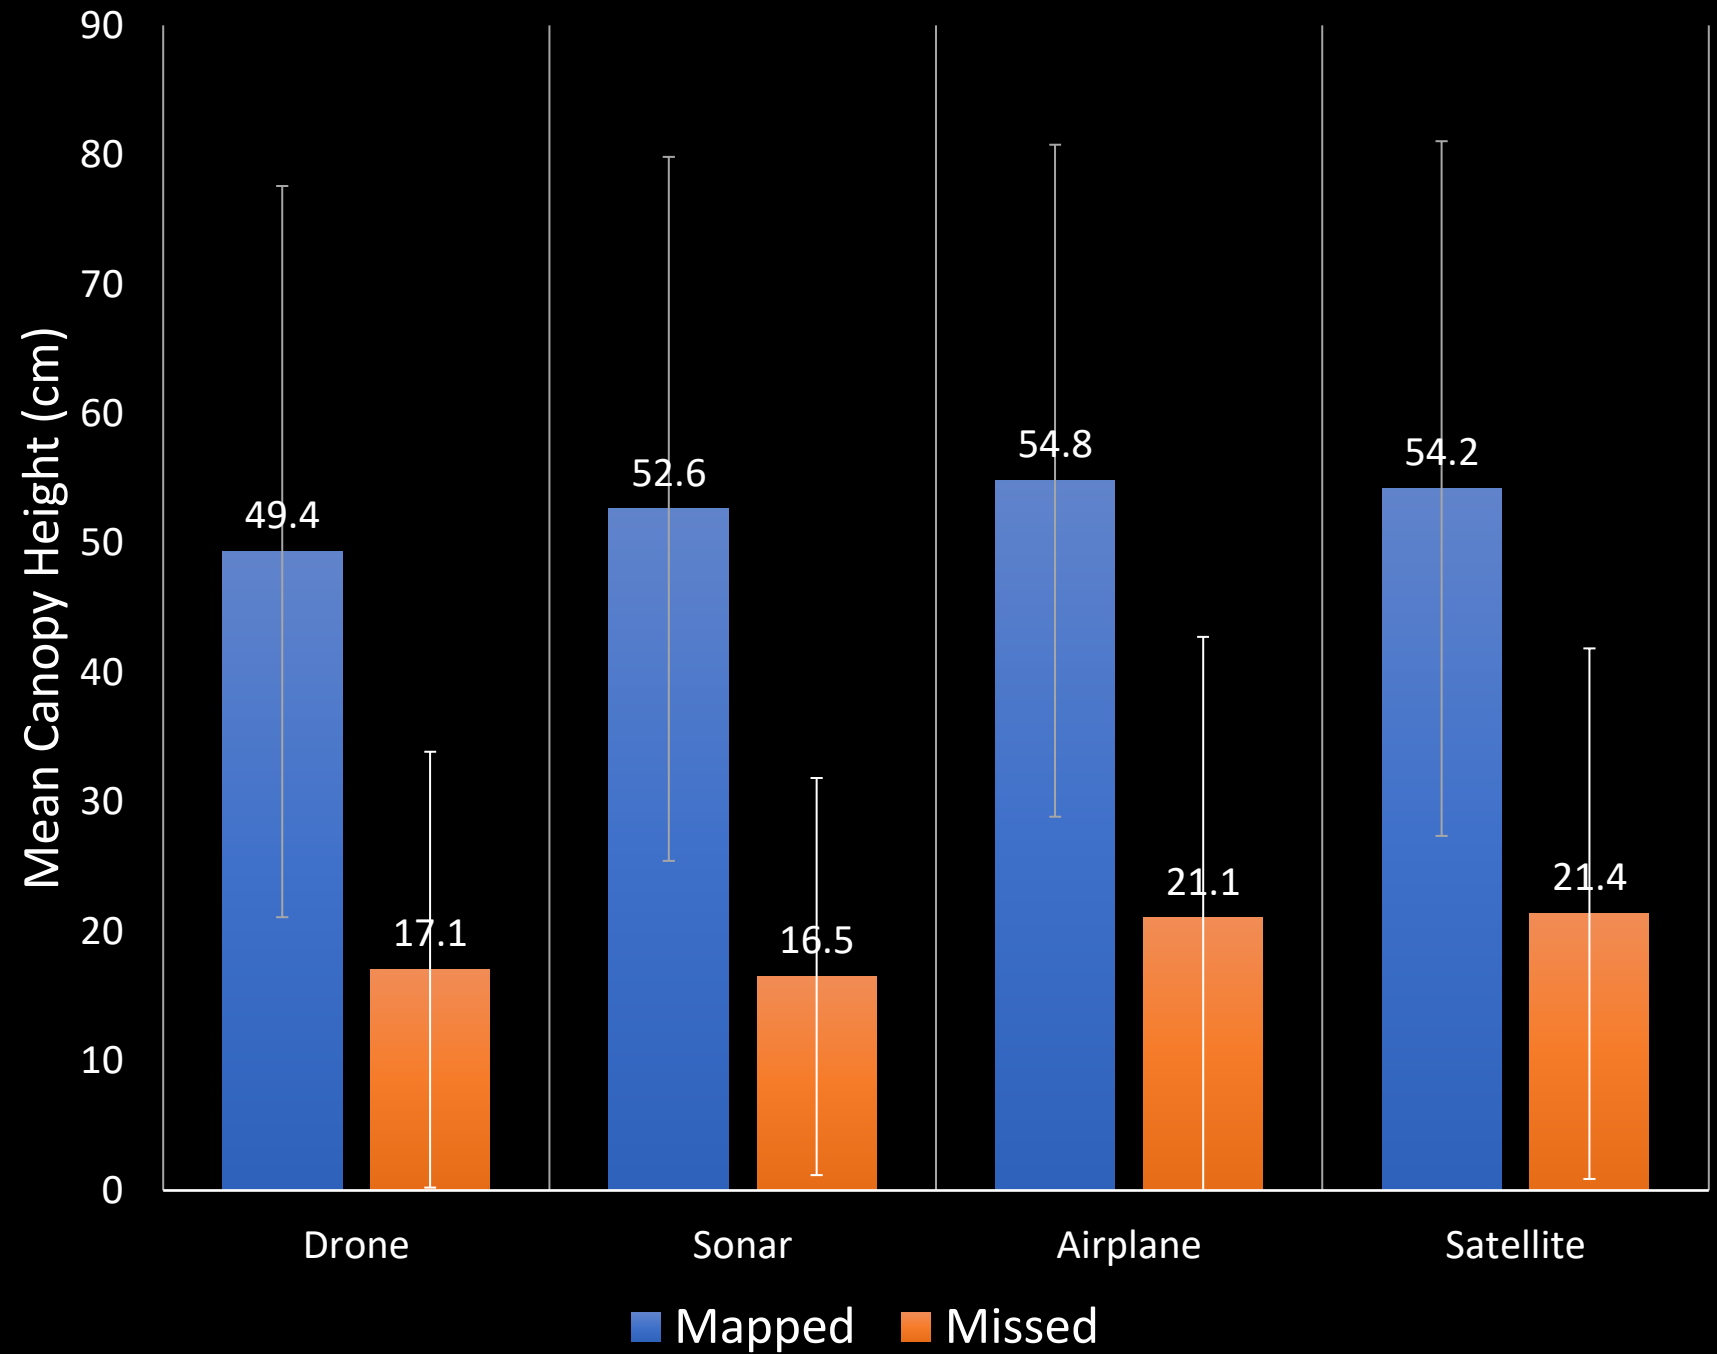

# Accuracy Assessment: Percent Cover

	1-10	11-20	21-30	31-40
Drone	79%	92%	96%	91%
Sonar	68%	97%	89%	96%
Airplane	56%	92%	89%	91%
Satellite	60%	85%	85%	87%

Site	Survey	1-10
Gloucester	Drone	86%
	Sonar	90%
	Airplane	86%
	Satellite	90%
Beverly	Drone	64%
	Sonar	59%
	Airplane	50%
	Satellite	18%
Swampscott	Drone	78%
	Sonar	52%
	Airplane	4%
	Satellite	78%
Nahant	Drone	68%
	Sonar	59%
	Airplane	45%
	Satellite	23%
Cohasset	Drone	94%
	Sonar	78%
	Airplane	91%
	Satellite	78%

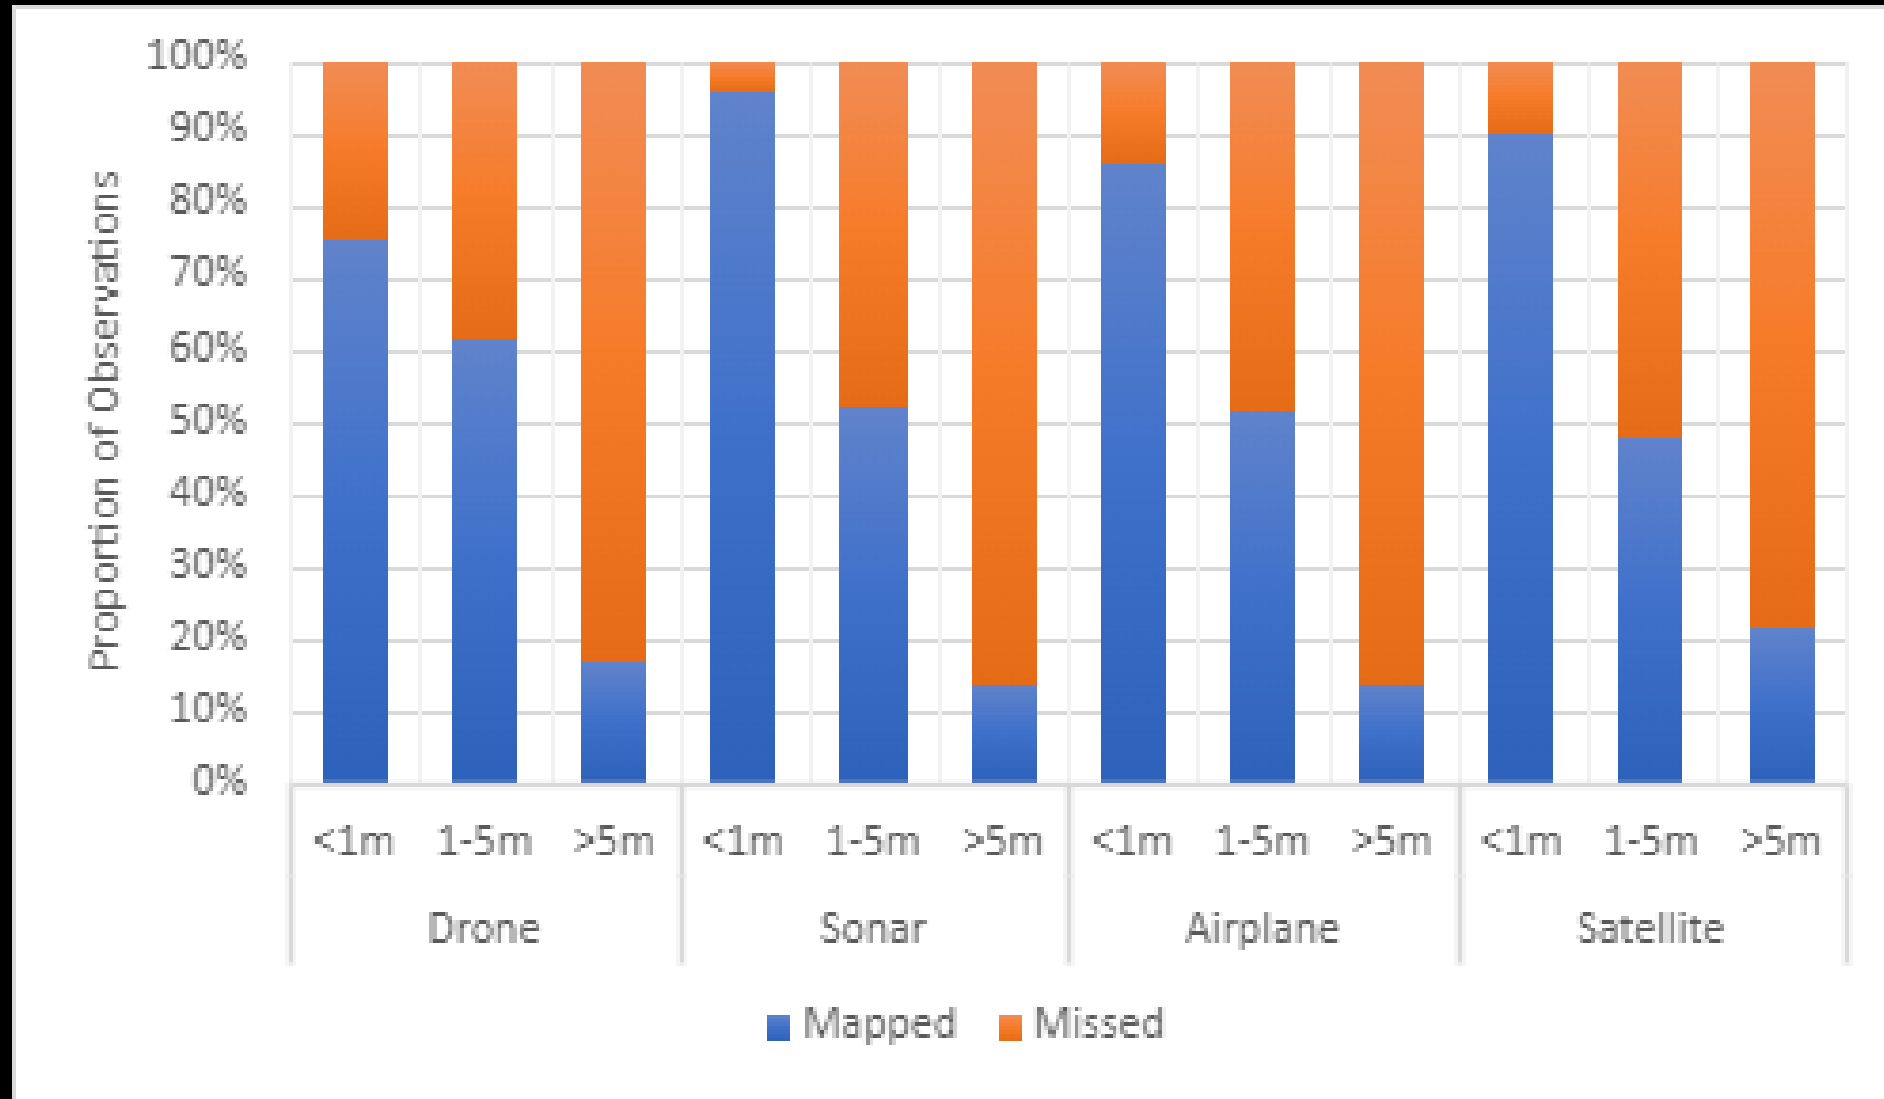

# Effects of Canopy Height

# Effects of Distribution Type

*Continuous* <1 m  
*Transitional* 1-5 m  
*Patchy* >5 m

# Management Recommendations

- Apply conservation buffers = mean edge error to protect unmapped edge areas
- Prioritize use of drone and sonar
- Supplement airplane imagery with enhanced edge ground truthing
- Explore use of submeter satellite imagery
- Use edge errors to integrate maps from different methods

## Technical Report

Increasing agency confidence in eelgrass maps used for project review and ocean planning

Jill Carr | Massachusetts Bays National Estuary Partnership | [jillian.carr@umb.edu](mailto:jillian.carr@umb.edu)  
Todd Callaghan | Massachusetts Office of Coastal Zone Management | [todd.callaghan@mass.gov](mailto:todd.callaghan@mass.gov)

# Thank you!

Thanks to NOAA for funding

Thanks to our **project partners**: Kate Frew, Forest Schenck and Iris Seto (DMF), Tay Evans and David Hilgeman (MassDEP), Julie Simpson (MIT Sea Grant), Sara Grady and Taylor Czybora (NSRWA), Randall Hughes, Lizzy Sorano and Neida Villanueva-Galarza (NEU Marine Science Center), and Emily Flaherty and Alison Frye (SSCW).

We also thank our project **advisory committee**: Mark Borrelli, Phil Colarusso, Mark Finkbeiner, Darryl Keith, Michael McHugh, Dan Sampson, Stephen Young; our **StoryMap creators**: Anne Donovan and Betsy Rickards; and **fieldwork helpers** Susan Bryant and students from CSCR.

# Eelgrass-Aquaculture Interactions

## Aquaculture and Eelgrass: A Science and Management Roundtable

Tuesday, November 15, 2022  
Virtual via Zoom

Keynote: Howarth

Paired mgr/sci talks  
from

- Canada
- Maine
- New Hampshire
- Massachusetts
- Rhode Island
- Connecticut
- NOAA

<https://www.youtube.com/watch?v=pFJ24PC3faQ>

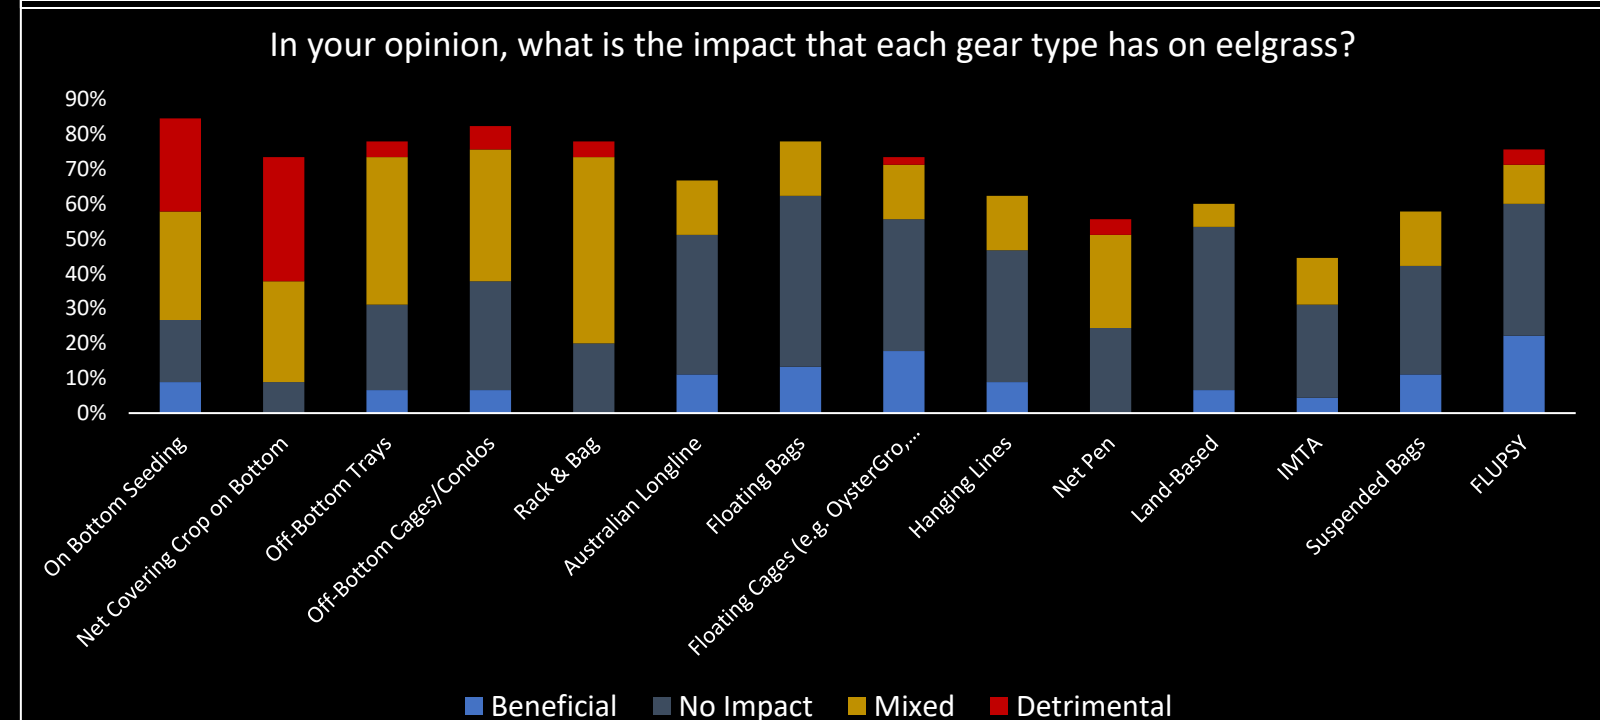

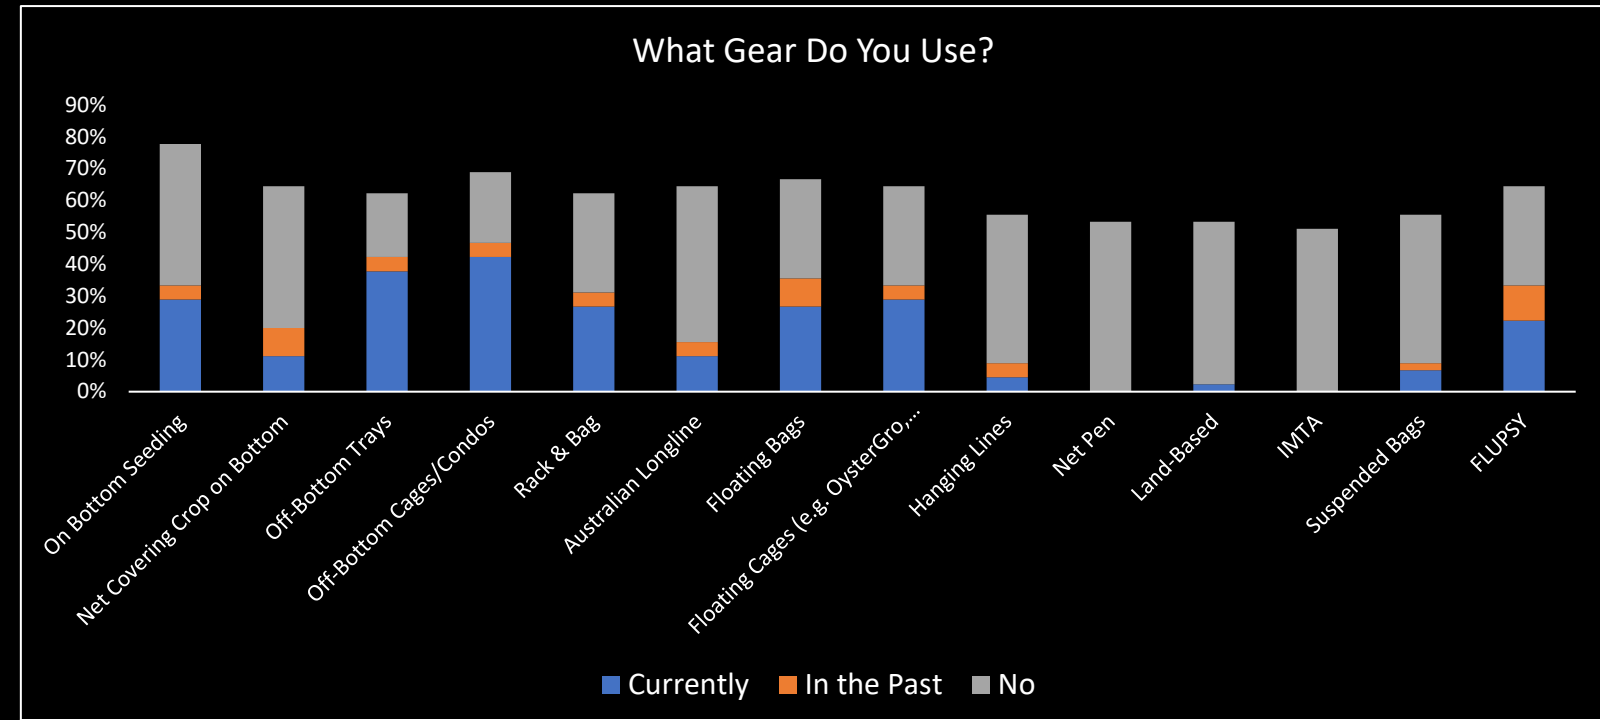

# Eelgrass-Aquaculture Interactions

## Priority areas for research and management:

- Adjust regulatory stance of expansion of eelgrass into leases
- Quantify impacts (positive and negative) of co-location or near-location
- Infuse adaptability to regulations
- Permit and support research program
- Improve eelgrass mapping and modeling

# Jan 2023: Grower survey

## 45 respondents ME to NC

# Jan 2023: Grower survey

## 45 respondents ME to NC

If a research project were to explore the interactions between aquaculture and eelgrass, would you be willing to use your farm as a demonstration/study site?

# Jan 2023: Grower survey

## 45 respondents ME to NC

Nature of Concern for Engaging in Conversation

# Summer 2023: Municipal survey

## 18 respondents (MA)

# Next steps

- Research development
- Work with towns and state on regulatory barriers
